

Treatment of Betty Patrick using Silver 100

at Coral Springs Medical Center (admitted January 21, discharged March 7)

When the IV antibiotics were not working and the doctors were telling the family to begin making funeral arrangements, the family insisted they begin using Silver 100. Treatment with Silver 100 began on day 24 (1 oz 3x/day, through the feeding tube).

The following chart shows the “white blood cell” readings from the hematology section of the hospital’s lab reports. (The original lab reports from the hospital are available on request with appropriate confidentiality arrangements.)
